Wiper Transmission Linkages

Will it Work or Not?

- **GM Recalls OE Boards**

General Motors used an intermittent wiper board assembly that covered GM trucks from 1988 through 2003 model years. Unknown at the time of production, were several design defects that did not surface until later. These defects eventually led to a recall by GM.

88136
GM Wiper Pulse Board

GM trucks, 2003-88. Includes new cover plate and hardware.

- **Original Unit Failures**

The original unit used a technique in which the electronic components were soldered to the surface of the board. As part of the build process, a clear coating called “Conformal” coat was sprayed on the board to protect the electronic components and the circuit board from corrosion. In the original configuration, the Conformal coating would move components that were soldered to the board as it heated and cooled. This pushing and pulling motion caused component connections to come loose. As a direct result of thermal stress, cracks would appear on the surface of the printed circuit board. These cracks (due to poor quality solder joints), would open when the board got hot. Any of these conditions could lead to intermittent operation or in some cases complete failure of the intermittent function of the wipers.

- **DORMAN® Improvements**

The Dorman® **88136** incorporates several improvements:

- new soldering techniques
- a double sided board with plated through holes
- better terminal solder adhesion
- better resistance to thermal stress
